

PREPARED FOR BARON DAVIS & CHIZZ CUNNINGHAM

Sport, media and the fan, 1921 to 2026.

How the internet consumes sport, who gets the credit, and how the people who built the game plug into what comes next.

Ballast · September 2026

MARCH 2, 1962 · HERSHEY, PENNSYLVANIA

Wilt Chamberlain scored 100 points. 4,124 people saw it. It was not televised, and no film of it exists.

The game survives through a radio recording, one photograph and the people who tell the story. Every athlete holds stories like it. Few have a place to tell them in their own words, to the fans who want to hear them.

Source: Library of Congress, National Recording Registry

Ballast · 02

A research and development team for History of the Game.

The athlete

Tells their own story

In their own words, with the memories, objects and people around each moment. Footage helps. It is not required.

The fan

Takes part

Learns, shares a memory, asks a question, collects something, attends something.

The athlete, again

Launches things

Memorabilia, digital assets, experiences, businesses and creative projects, alone or with leagues and brands.

We research the audience and the possible partners, develop a few ideas, and work out which one is worth trying first.

Wilt's 100-point night survives as a photograph and a radio recording. LaMelo has been on camera since high school.

1962. 4,124 people in the building. Not televised. What survives is a radio recording of the fourth quarter and this photograph. The league, the newspapers and the networks decided who saw him.

2017 onward. A family reality show and a professional contract in Lithuania at 16. Nearly all of it survives, spread across platforms and mostly unlabelled. The family, then the player, then the platforms decided who saw him.

People now meet sport as a clip, in a feed, often as someone else's remake of it.

Video is how the world takes things in. In 2022 it was 65% of all internet traffic.

The clip

People watch the clip

51% of 25 to 34s and 47% of 18 to 24s say highlights are replacing live games for them. For all Americans it is 38%.

The remake

People remake it

LaMelo Ball's "ion run it" clip is from around 2019. In 2026 TikTok still has pages of remakes, stickers and replies to it.

The feed

People find it in a feed

National NBA games are on three services and local games on a fourth. There is no one place where the whole audience meets.

AI does the same thing at machine scale.

What it is made from

Everything already posted

Generative models are built from what is online. A highlight, a quote and a career all go in, and come out without a name on them.

What it can make

Footage

OpenAI put generated video in a consumer app in 2025. It passed one million downloads in five days, and OpenAI closed it in April 2026. Other tools remain.

What it cannot make

An original

A generated clip has no author, no date and no source. The real one, with all three attached, becomes the scarce thing.

[This morning, on X](#) A 29-second AI-made video passed 1.4 million views in nine hours. Asked how it was made, the person who posted it replied: “i stole it from a whatsapp group.” Nobody in the thread knows who made it.

When a moment comes back around, the useful part is who is sharing it and why. The view count alone can be manufactured.

Clips get bunched by association: one player, one theme, one sound. With AI tools the variants are easy to make. So we read who is sharing, what they say, and whether they then visit, join, take part or buy.

A copy that links back sends people to the original. A copy that does not sends them nowhere.

SAME CLIP, COPIED WITH NO LINK BACK

The copies get watched. The original does not. Someone who sees a copy stays with the account that posted it. A thousand reposts, and the player gains no follower, no visit and no sale.

SAME CLIP, EVERY COPY WITH A NAME AND A LINK

Every copy is a way in. The clip shows the player's name and links to their own account. A thousand reposts become a thousand routes to the player.

Going viral again is a moment to use. What makes it worth something to the player is being the place every copy leads to. We have not measured this yet. It is the first thing we would test.

The best tapes in the world: found by the best archivists, cut by the best editors, signed off by the athlete.

The story is the starting point. From it an athlete can launch things of their own.

For each one we work out why it makes sense for both sides, who handles what, and what needs approval. An athlete controlling their story does not mean they own the footage.

The people already posting the game are the people to build this with.

The fan archivist

One fan keeps Wilt's era online

The Wilt Chamberlain Archive channel on YouTube cuts its own documentaries and game highlights from rare film.

83,200 subscribers, 426 videos, 52.7 million views.

The repost account

One Instagram account became a media company

House of Highlights began as an Instagram account run by one person, Omar Raja. Bleacher Report bought it.

By 2017: 6.8 million followers, 400 million views a month, up to 400 fan submissions a day.

The league

The NBA already equips editors

In October 2024 the league said it would give selected creators its footage and editing tools.

More than 25,000 hours of game footage, with AI-driven editing tools.

All three are about athletes. None of them is made with the athlete. That is what History of the Game can add.

Start with a moment that is already going around, and the people already posting it.

Four weeks, one question: when the athlete joins the people already posting, do fans follow it back to the athlete?

When	What happens	What comes out of it
Week 1	We pick a moment that is already going around, and map who is posting it: which editors, which archive accounts, and what people are saying under it.	A short list of the two or three people who post it best.
Week 2	We bring those editors and archivists in, with credit and pay. The athlete gives them what they cannot get anywhere else: ten minutes on camera about that moment.	One tape, cut by people fans already follow, with the athlete in it.
Week 3	The tape goes out on the editors' accounts and the athlete's at the same time, each with the name, the handle and History of the Game as its home. Fans reply. The athlete answers five.	The athlete reaches fans where they already are, through accounts they already trust.
Week 4	We count who followed it back, who came back, who asked to buy one of three things tied to the moment, how many hours it cost the athlete, and what the editors want to make next.	The numbers to decide whether to run a second one, and with whom.

Five kinds of research, and what you get from each.

01

Tech

Compare ways to verify athletes, authenticate memorabilia, or link a purchase to an experience.

You get options, costs and a recommendation.

02

Culture

Track a highlight that is coming back around: who is sharing it, and why.

You get what the athlete could do with that attention, including a possible collaboration.

03

Data and analytics

Test a story, a Q&A and a memorabilia preview against each other.

You get which one gets people to join, take part, come back or buy.

04

The game

Find overlooked career moments and milestones.

You get the background, the interview questions, the people to involve, and the footage or memorabilia that exists.

05

Aesthetic value

Develop the look of an athlete's profile, collection or collaboration.

You get designs, with fan feedback on how they look and whether they represent the athlete.

A media buyer, a designer and a former YouTuber.

Three different backgrounds. No fixed lanes: all three of us work across the research, the ideas and the testing.

Jack Morello

Eight years buying media. iHeartMedia for Toyota and Starbucks. Laundry Service, social for Jordan Brand. Campaigns for Disney, Netflix, Sony and NBC. \$2M+ a month at peak, held at 4x.

Chris Pennino

Ten years consulting on brand strategy, identity and worldbuilding through build_cities. Projects with Nike, Adidas, Rick Owens and Balenciaga. A background in residential architecture. Trained, taught and did research at SCI-Arc, on culture and technology.

Bilal Dhouib

Started a YouTube channel at 11 and built it to 180,000 subscribers. 13 years in growth across Web3, AI, fintech and gaming. Led growth at Bud, acquired by Figma.

We would like to be the research and development team for History of the Game.

Every week

A short note

For example: a highlight is going viral, here is why, here is who is interested, and here is what we think the athlete should do with it.

Every month

One real project

For example: two ideas for a fan experience or a memorabilia release, interest tested, one recommended, with what it takes to run and where a partner fits.

Every quarter

A review

What is working, what fans return for, what is selling, and how much time athletes are putting in. Then we agree what to do next.

First 90 days

Month one: understand the platform and talk to fans and athletes. Month two: develop and test ideas. Month three: help run a small pilot if it is feasible, and review what we learned.
